DRILLLOOP / DECISION BRIEF

Product and commercial review

A factual review of the working demo, its evidence limits, and the questions to answer next.

Current evidence: one fictional exercise fixture

No customer, revenue, field-accuracy, or deployment claim is established.

Independent replacement presentation

A working local demo; market proof is still open

Separate what the repository demonstrates from the claims that still need outside evidence.

01

Local workflow

Exercise setup, evidence intake, source-linked review, corrective actions, and report export are implemented in the demo.

02

Evidence base

The packaged example is fictional. Current measured matching results come from one deliberately constructed fixture.

03

Commercial status

No customer use, paid pilot, purchase decision, workload reduction, or willingness to pay is documented.

Review boundary

A successful demo run is not evidence of customer demand, deployment readiness, or performance on unfamiliar records.

The product is a review trail, not an auto-approval system

Each proposal should remain tied to its source and to a human decision.

1

Source record

File plus row, line, page, or segment

2

Observation

What the record says

3

Proposed finding

Interpretation with uncertainty

4

Human review

Authorized reviewer decides

5

Closure proof

Reviewer checks completion evidence

Human gate

Drafts stay proposed until an authorized reviewer acts. An action stays open until closure evidence is reviewed.

What the current demo supports

A bounded, local-first workflow over the evidence types described in the project documentation.

A	**Set up an exercise**	Record objectives, targets, teams, and the review context.
B	**Bring in evidence**	Import notes, CSV logs, JSON records, and selectable-text PDFs.
C	**Review proposals**	Inspect linked source passages, conflicting times, and unknown details.
D	**Track follow-through**	Assign action fields, record closure proof, and export a report.

The default analysis uses local deterministic rules; optional speech and writing-model paths are separate and were not part of the cited fixture result.

The recorded fixture checks pipeline wiring

All three counts refer to one closed fictional exercise dataset.

8 / 8

expected event-log rows found

Row-presence check

5 / 5

expected finding labels proposed

Closed label set

9 / 9

expected source IDs linked

ID-presence check

Limit A linked identifier does not prove that a source supports a claim. No unfamiliar exercise or representative evaluator study is included.

The next proof points are still unmeasured

No numerical market or field-performance claim should be inferred from the demo.

Product evidence to collect

- Use with permitted real exercise records
- Evaluator corrections and source-support judgments
- Preparation time compared with current practice

Commercial evidence to collect

- Customer demand, buyer, and procurement route
- Willingness to pay, delivery cost, or revenue
- Real-audio transcription and unfamiliar-case performance

Treat each item as unknown until a permitted review produces evidence.

A first user segment is proposed, not validated

The product concept starts with hospital tabletop exercise review.

PROPOSED FIRST USER

Hospital preparedness evaluator

Reviewing records from a tabletop exercise

Report preparer	Evaluator or preparedness staff member is a likely role.
Approver	Preparedness lead or exercise sponsor is a candidate.
Budget owner	Unknown in the repository evidence.
Procurement route	Unknown in the repository evidence.

The commercial model has no validated inputs

A per-exercise pilot fee is a question to investigate, not a price or offer.

Option	Current evidence	Question before modeling
Per-exercise pilot	First model to investigate; no price set	Who buys, what approval route applies, and what delivery work is required?
Organization subscription	Later hypothesis; not priced	What exercise volume, support, renewal, and user roles would be needed?
Private deployment	Later hypothesis; not costed	What hosting, identity, security, and operations requirements apply?

No price, customer volume, revenue, delivery cost, or staffing forecast is established.

Test the connected review trail against current practice

The project materials recognize that reporting and follow-up workflows already exist.

What is already familiar

After-action reporting and corrective-action tracking are established workflow categories.

A report template alone is not a unique product claim.

What DrillLoop will test

Source passage -> proposed finding -> reviewer decision -> checked closure evidence

Value and distinctiveness remain unvalidated.

Compare both workflows on the same permitted records and ask evaluators where they correct or reject proposals.

The demo boundary is narrower than an approved service

Keep data fictional or explicitly permitted until owners approve operational controls.

LOCAL-FIRST

The default deterministic path needs no cloud model API.

SYNTHETIC

The packaged exercise records are fictional demonstration data.

HUMAN REVIEW

Proposals are not approved findings; reviewers decide.

NOT PRODUCTION

Identity, hosting, retention, and security operations still need owner approval.

No staging or production approval is evidenced by this product review.

A small discovery sequence can answer concrete questions

Each step depends on participant permission and a defined evidence scope.

01	**Listen**	Interview prospective evaluators; map users, approvers, current tools, and permitted records.
02	**Compare**	Review the same approved records with current practice and DrillLoop.
03	**Measure**	Record review time, corrections, citation support, and action-field completeness.
04	**Decide**	Agree thresholds with participants before testing an unfamiliar exercise or proposing a pilot.

This is a proposed learning plan, not a confirmed partner, schedule, or pilot commitment.

Authorize learning before asking for a pilot

The immediate decision concerns discovery scope and evidence permissions.

REQUESTED DECISION

Decide whether to authorize discovery and design a paired review for the hospital tabletop use case.

First confirm participant roles, evidence permissions, and the comparison measures.

Not requested here

- Production deployment
- Scale-up decision
- Validated business case

No response is implied; an owner must record the decision.
