EUREKA / PRODUCT PITCH

DrillLoop

From exercise notes to findings a person can review and improvements a person can verify.

Every proposed finding links back to its source.

WORKING MVP

Fictional hospital prolonged power outage · 27 October 2026

The claim stays connected to its source and its reviewer decision.

THE PROBLEM

The exercise ends. The evidence work begins.

Evaluation is a reconciliation job across files, clocks, objectives, and people.

01

Evidence is scattered

Evaluator notes, control-room logs, transcripts, and reports use different formats and detail.

02

Timelines disagree

Missing times, conflicting statements, and recognition errors can make event order look more certain than it is.

03

Actions lose momentum

Findings become difficult to assign, review, and verify after the report is written.

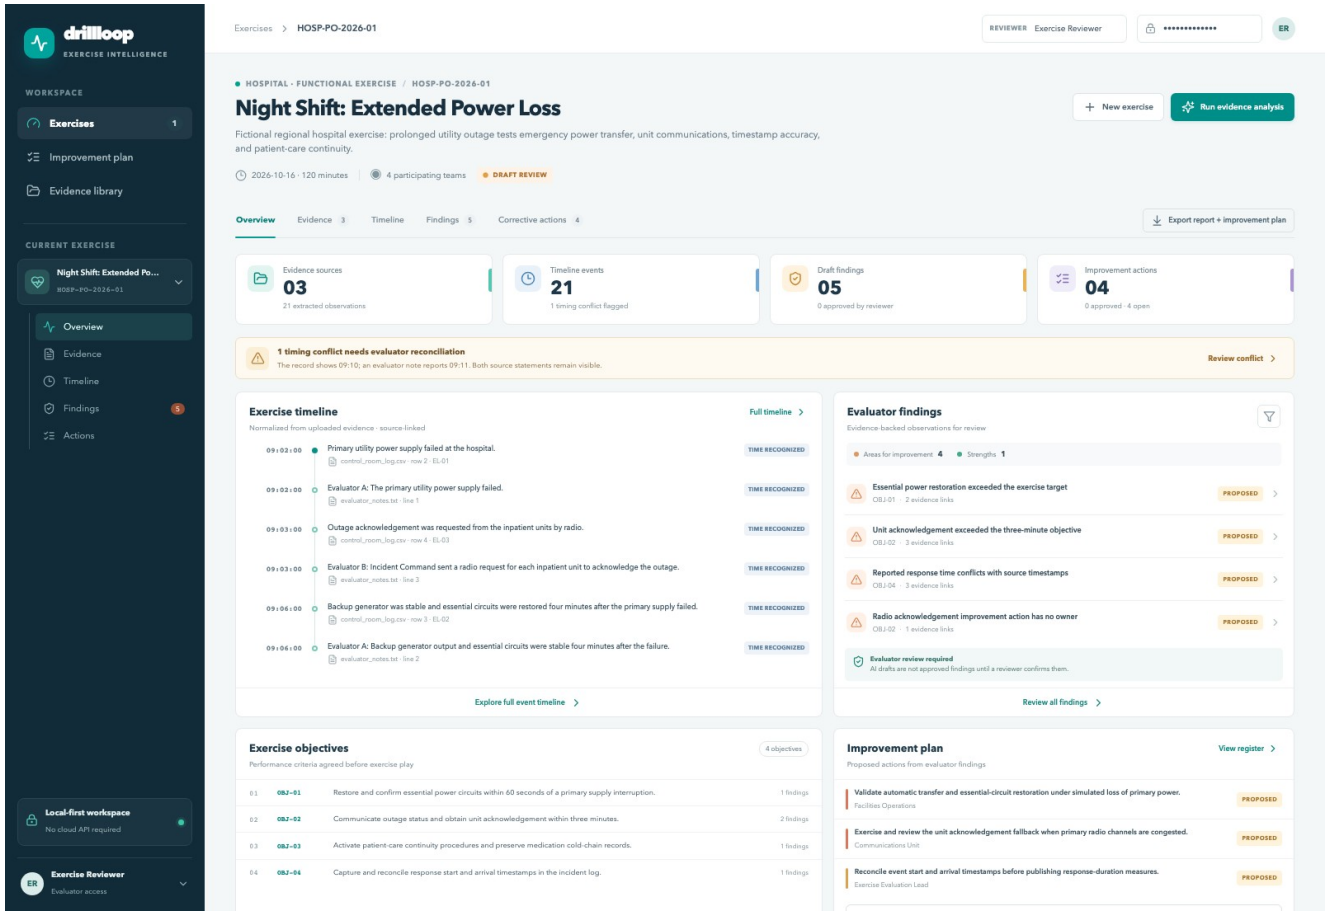

What teams need

A review trail that shows what the evidence says, what the evaluator concludes, and who verifies the improvement.

The amount of time saved and the size of the gap vary by organization; neither has been measured yet.

One review workspace for the whole exercise

Follow evidence through to an after-action report and improvement plan (AAR/IP).

Screenshot captured from the running app. All exercise content is fictional.

SYNTHETIC HOSPITAL EXERCISE

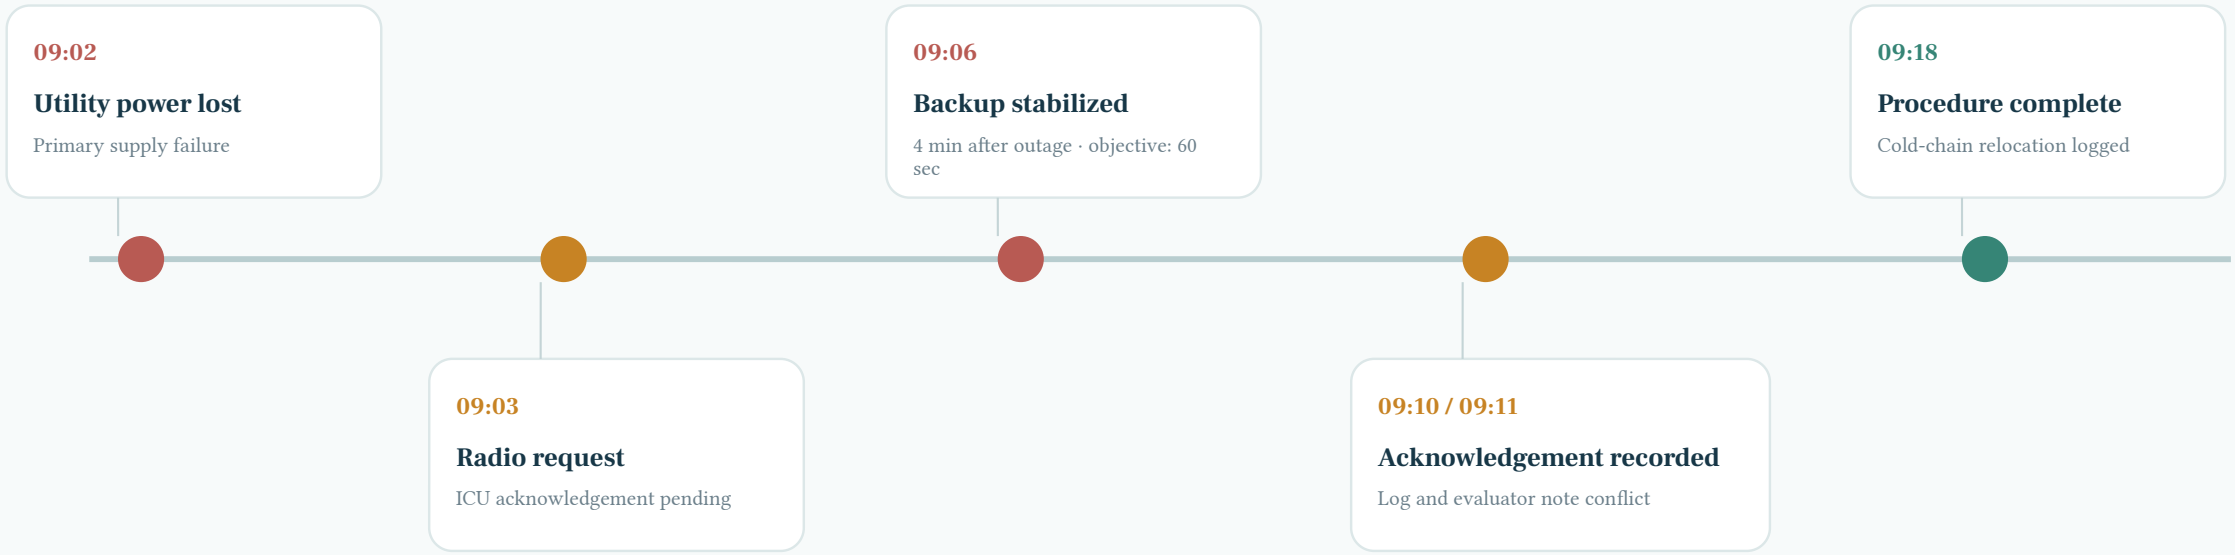

The screen keeps together:

- **Exercise plan**
  Objectives and milestones
- **Evidence**
  File and source locator
- **Timeline**
  Known, missing, and conflicting times
- **Review**
  Proposed vs approved status

DEMO SCENARIO

A power outage with evidence that does not all agree

Hospital HOSP-PO-2026-01 · Night Shift: Extended Power Loss · fictional exercise.

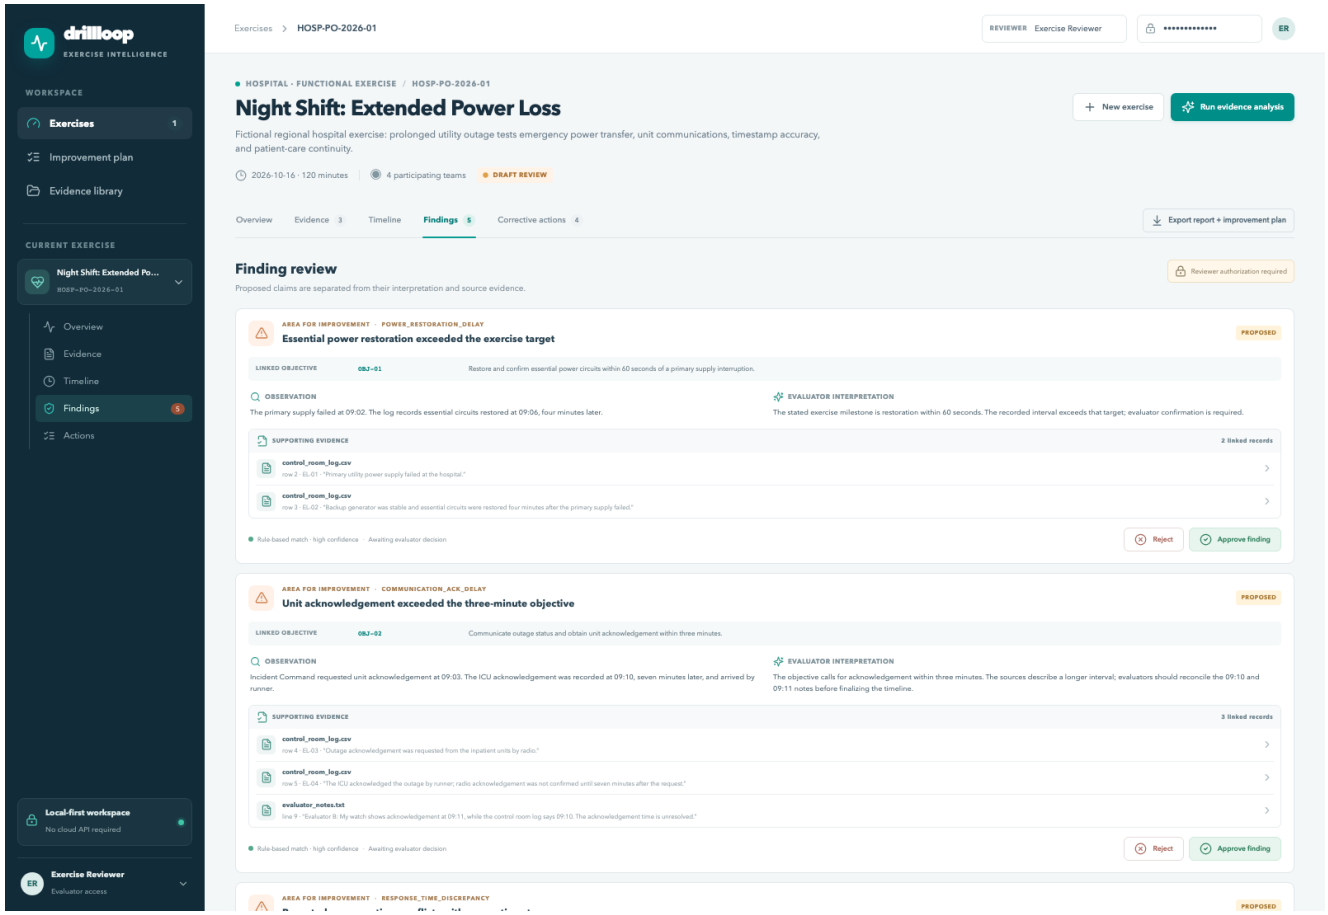

Uncertainty stays visible

09:10 vs 09:11 is unresolved. “Generator lagged a bit” has no time or measure, so it is not ordered as a confirmed event.

Open the source behind every draft

See what the record says, what it may mean, and where a reviewer can check it.

No finding is approved by the model. Reviewer decision remains explicit.

DRAFT FINDING

Delayed ICU acknowledgement

WHAT IT MAY MEAN

About 7 minutes observed; exercise target is 3 minutes.

SUPPORTING RECORDS

CSV rows 4–5

Note line 9

DRAFT / awaiting evaluator

The response-time discrepancy cites the independent event log; the low-confidence “too minutes” transcript phrase remains uncertain.

AI WORKFLOW

A fixed pipeline keeps the evidence path inspectable

The MVP uses deterministic extraction for the demo fixture. Optional local models stay behind defined boundaries.

01

Collect files

Notes · spreadsheets
transcripts · readable PDFs

02

Record details

Keep exact file location
and known / unknown time

03

Compare

Compare recorded events
with exercise targets

04

Link evidence

Show the exact source
behind every proposal

05

Human review

A person decides
approve / reject

OPTIONAL LOCAL SPEECH-TO-TEXT

faster-whisper can turn audio into draft text when installed. Demo transcript is pre-written; speakers are not identified.

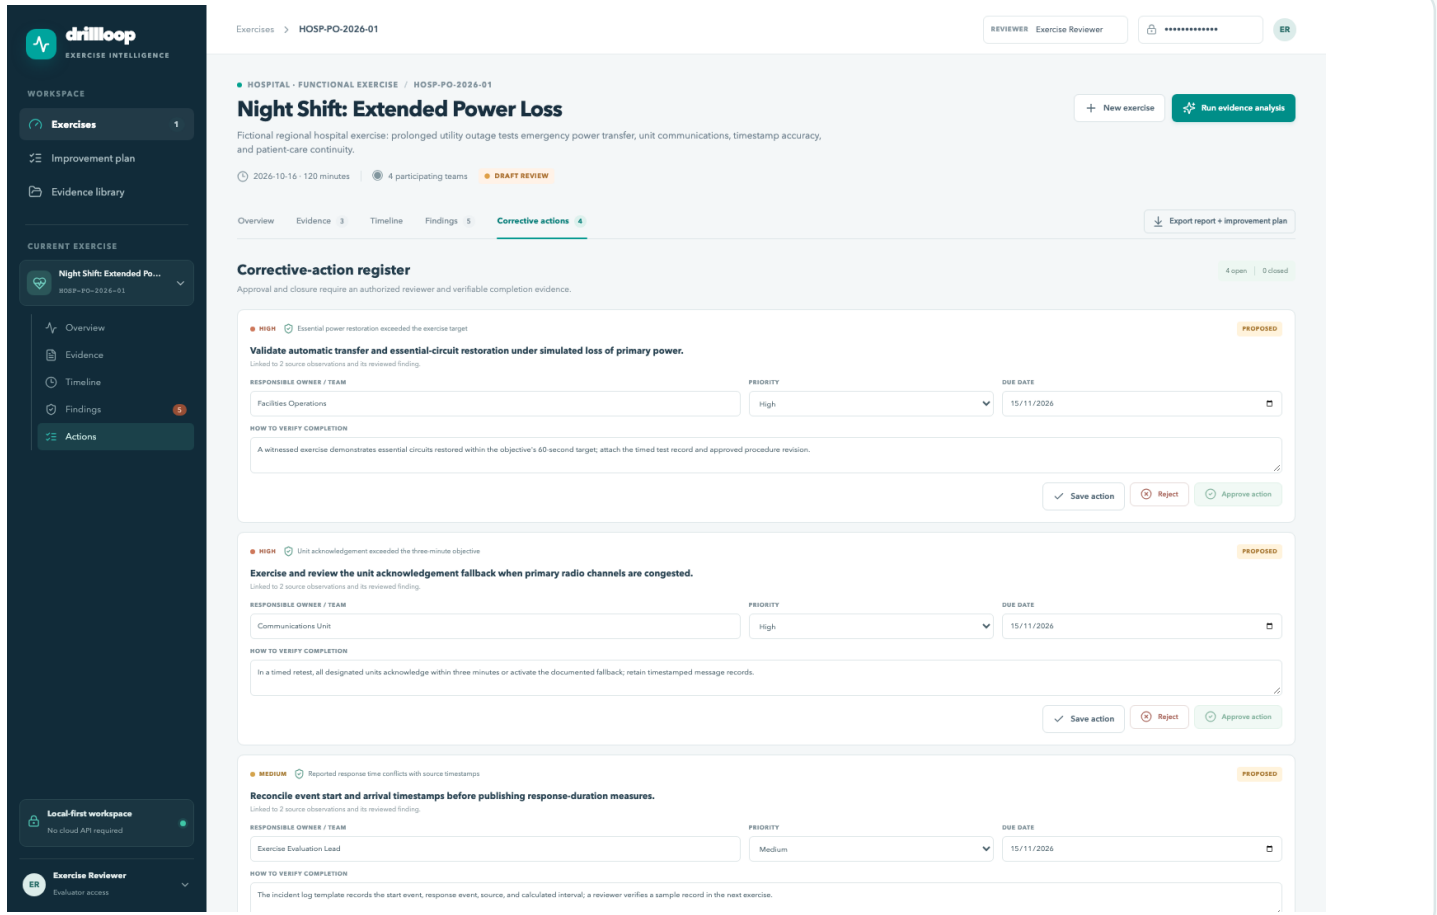

OPTIONAL LOCAL WRITING MODEL

Ollama may reword an action draft only. It cannot create a finding, change a source link, or make a reviewer decision.

Same evidence ✦ same rules produce a repeatable draft. The evaluator still decides.

A finding stays open until its improvement is checked

Every action needs an owner, a due date, a clear test for completion, and reviewer confirmation.

Proposed

Finding awaiting review

Assigned

Owner + due date

In progress

Acceptance criteria

Closure review

Attach completion proof

Closed

Reviewer confirms

Missing owner stays unassigned.

MARKET CONTEXT

The category already has AAR and action-tracking tools

DrillLoop should validate a focused workflow advantage instead of claiming report generation is unique.

OPTION / CONTEXT	PUBLICLY VISIBLE SCOPE	IMPLICATION TO TEST
FEMA exercise guidance	Exercise planning and evaluation steps	Use familiar structure; no claim of certification.
Veoci	Publicly describes AAR reports, timestamps, transcripts, and corrective actions	Direct competitor; compare source-level review and closure in customer demos.
D4H	Emergency-team readiness, incident, personnel, and equipment workflows	Adjacent incumbent; confirm evaluation evidence workflow depth.
DrillLoop hypothesis	Exact source observation → human decision → closure evidence	Potential niche; uniqueness and willingness to pay remain unvalidated.

Sources: FEMA exercise guidance · Veoci after-action reporting · D4H team readiness. Public pages, not a scored teardown.

Start where exercise evidence and follow-through meet

A hospital preparedness team is the first pilot hypothesis, not a validated customer segment.

FIRST PILOT HYPOTHESIS

Hospital preparedness lead

Owns exercise planning, evaluation coordination, and improvement follow-up.

Evaluator

Captures observations and confirms findings.

Action owner

Delivers task and submits closure evidence.

Preparedness director

Reviews open risks, trends, and readiness.

Adjacent customer candidates

- Municipal emergency teams
- Airports & critical infrastructure
- Civil defense & training providers

Pilot question: Is source-level traceability painful enough to buy or integrate?

Test pricing against measured value and delivery cost

All prices and financials are illustrative assumptions, not market quotes or a forecast.

PRICE PROBES

Per exercise	**$1,500**
Annual organization · up to 12	**$18,000**
Private deployment	**$65,000 / year**
Custom template	**$6,000**
Support services	**$1,500 / day**

Simple annual scenarios

SCENARIO	Revenue	Costs*	After costs*
Conservative	$177k	$385k	**$208k**
Base	$488k	$645k	**$157k**
High scale	**$2.05m**	$1.87m	**$180k**

*Revenue minus assumed staffing and other costs; not net profit.

Time-value illustration: 96 capacity hours / year ≈ $6,240 at $65 loaded hourly cost. Not cash savings.

20 h/exercise × 40% potential reduction × 12 exercises × $65/h. Assumptions need pilot measurement.

TECHNICAL FOUNDATION

Simple local app, with a person at the review gate

The demo can run without a cloud AI service; optional models stay on the computer.

Website screen

Exercise setup
Evidence review
Action tracking
React + TypeScript

Application service

Checks uploaded files
Applies review rules
FastAPI + Pydantic

Saved records

SQLite for the demo
PostgreSQL for deployment
SQLAlchemy database tools

Reports ✦ optional local AI

PDF report: ReportLab
Speech-to-text: faster-whisper
Action wording: Ollama

TRACEABLE RECORD

Original file ✦ file-change checksum ✦ extracted quote ✦ location ✦ reviewer decision ✦ completion proof

DEMO SECURITY BOUNDARY

One shared demo password. No individual accounts, separate customer workspaces, or deployment security controls.

Exact library versions and licenses are listed in the Technical Design.

The sample passed its checks; new exercises still need testing

Scores use one fictional exercise built for this demo. They do not measure evaluator agreement or general accuracy.

EVENT RECORDS	FINDING LABELS	SOURCE LINKS	RECORDED TIMES
8 / 8	5 / 5	9 / 9	8 / 8
All labeled rows found	All expected labels found	Expected record IDs linked	One disagreement shown

Measured

Rule request latency p50 4.61 ms · p95 9.13 ms
Peak process RSS 78.2 MB · no model loaded

Not measured

Manual prep time · reviewer edits · semantic citation quality
ASR WER/latency · local LLM quality and latency

Reading the old shorthand: precision = proposed items matching labels; recall = expected labels found. Both were 100% here because rules and labels used the same small scenario.

31 / 32 action fields were filled; one owner is intentionally missing. No evaluator study was run.

12 local test calls · no AI model loaded · results apply to this synthetic fixture only.

THE NEXT PROOF POINT

Pilot the review trail.

Prove that evidence traceability improves reviewer confidence and action follow-through in a real exercise workflow.

2–3 teams

Hospital or municipal exercise evaluators

90 days

Use synthetic or approved records with personal details removed

Measure

Review time · corrections · citations · closure proof

DrillLoop keeps the evaluator in control.

Proposed findings stay proposed. Corrective actions close only after reviewer confirmation.
